Confidentiality Statement

This document is the exclusive property of OWASP Juice Shop and Digital Egypt Pioneers Initiative (DEPI). This document contains proprietary and confidential information. Duplication, redistribution, or use, in whole or in part, in any form, requires consent of both OWASP Juice Shop and DEPI. OWASP Juice Shop may share this document with auditors under non-disclosure agreements to demonstrate penetration test requirement compliance.

Disclaimer

A penetration test is considered a snapshot in time. The findings and recommendations reflect the information gathered during the assessment and not any changes or modifications made outside of that period. Time-limited engagements do not allow for a full evaluation of all security controls. DEPI prioritized the assessment to identify the weakest security controls an attacker would exploit. DEPI recommends conducting similar assessments on an annual basis by internal or third-party assessors to ensure the continued success of the controls.

Assessment Overview

From November 10th, 2025 to November 28th, 2025, OWASP engaged DEPI to evaluate the security posture of its infrastructure compared to current industry best practices that included a webapp penetration test. All testing performed is based on the NIST SP 800-115 Technical Guide to Information Security Testing and Assessment, OWASP Testing Guide (v4), and customized testing frameworks. Phases of penetration testing activities include the following:

- **Planning** – Customer goals are gathered and rules of engagement obtained.
- **Discovery** – Perform scanning and enumeration to identify potential vulnerabilities, weak areas, and exploits.
- **Attack** – Confirm potential vulnerabilities through exploitation and perform additional discovery upon new access.
- **Reporting** – Document all found vulnerabilities and exploits, failed attempts, and company strengths and weaknesses.

Assessment Components

Web app Penetration Test

A web app penetration test emulates the role of an attacker on a web application. An engineer will scan the website to identify potential vulnerabilities and perform common and advanced web attacks, such as: Injections, broken access control and other Cross-site scripting (XSS) attacks, Improper Input Validation, and more. The engineer will seek to gain access to hosts through lateral movement, compromise domain user and admin accounts, and exfiltrate sensitive data.

Finding Severity Ratings

The following table defines levels of severity and corresponding CVSS score range that are used throughout the document to assess vulnerability and risk impact.

Severity	CVSS V3 Score Range	Definition
Critical	9.0-10.0	Exploitation is straightforward and usually results in system-level compromise. It is advised to form a plan of action and patch immediately.
High	7.0-8.9	Exploitation is more difficult but could cause elevated privileges and potentially a loss of data or downtime. It is advised to form a plan of action and patch as soon as possible.
Moderate	4.0-6.9	Vulnerabilities exist but are not exploitable or require extra steps such as social engineering. It is advised to form a plan of action and patch after high-priority issues have been resolved.
Low	0.1-3.9	Vulnerabilities are non-exploitable but would reduce an organization's attack surface. It is advised to form a plan of action and patch during the next maintenance window.
Informational	N/A	No vulnerability exists. Additional information is provided regarding items noticed during testing, strong controls, and additional documentation.

Risk Factors

Risk is measured by two factors: Likelihood and Impact:

- **Likelihood** : measures the potential of a vulnerability being exploited. Ratings are given based on the difficulty of the attack, the available tools, attacker skill level, and client environment.
- **Impact** : measures the potential vulnerability's effect on operations, including confidentiality, integrity, and availability of client systems and/or data, reputational harm, and financial loss.

Scope

Assessment	Details
Web-Server Penetration Testing	OWASP JUICE SHOP

- ✓ **In scope**

"The scope includes the entire **OWASP Juice Shop** application, all core functionalities, and user-accessible interfaces."

<https://juice-shop.herokuapp.com/#/>

- ✗ **Out of scope**

Per client request, DEPI did not perform any of the following attacks during testing:

- Denial of Service (DoS)
- Phishing

Executive Summary

DEPI evaluated OWASP's Juice Shop posture through penetration testing from November 10th, 2025 to November 28th, 2025. The following sections provide a high-level overview of vulnerabilities discovered, successful and unsuccessful attempts, and strengths and weaknesses.

Scoping and Time Limitations

Scoping during the engagement did not permit denial of service or social engineering across all testing components.

Time limitations were in place for testing. Webapp penetration testing was permitted for (18) business days.

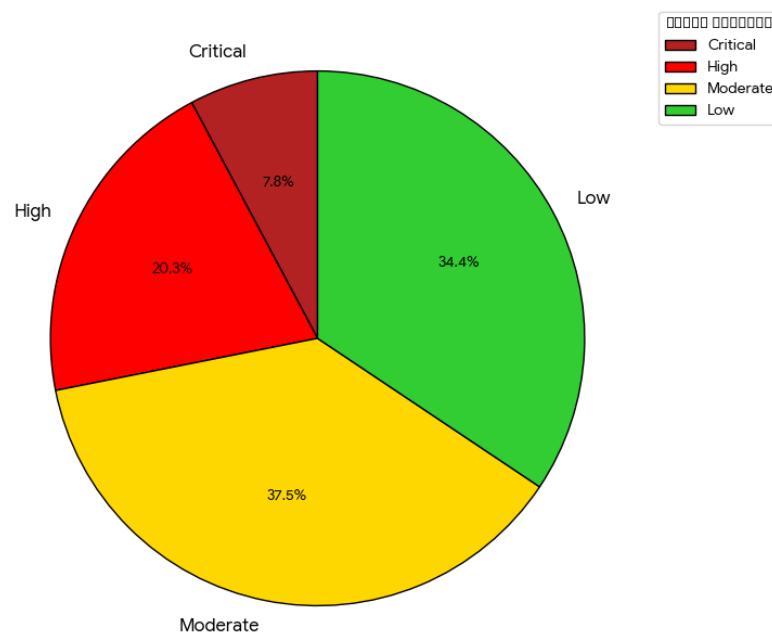

Vulnerability Summary & Report Card

The following tables illustrate the vulnerabilities found by impact and recommended remediations:

Internal Penetration Test Findings

Informational	Low	Moderate	High	Critical
0	22	24	13	5

Pee Chart

Internal Penetration Test		
Finding	Status	Category
Allowlist Bypass	Passed	Unvalidated Redirects
Outdated Whitelist	Passed	
Bully Chatbot	Passed	
Mass Dispel		

	Passed	
Privacy Policy	Passed	
Security Policy	Passed	
Exposed Metrics	Passed	
Bjoern's Favorite Pet	Passed	Miscellaneous
View Basket	Passed	Broken Authentication
Forged Review	Passed	Implement robust input validation and business logic checks to ensure data integrity. Consider rate limiting and user verification for review submissions.
Error Handling	Passed	Configure the server and application to suppress detailed technical error messages (such as stack traces or server versions) in production environments to prevent information leakage .
Zero Stars	Passed	Enforce business logic checks and server-side validation to ensure rating systems cannot be bypassed or abused (e.g., zero-star spamming) via client-side manipulation.
Mint the Honey Pot	Passed	Implement advanced anti-automation controls (behavioral analysis, rate limiting) to prevent the automated abuse of features designed to catch attackers.
Legacy Typosquatting	Passed	Rename or consolidate legacy application components that use easily typosquatted names. Implement input normalization to reduce user confusion and potential exploitation.
Payback Time	Passed	Implement thorough business logic checks and access controls to prevent users from performing unauthorized or retaliatory actions (e.g., fraudulent refunds or data modification).
Misplaced Signature File	Passed	Ensure all critical files, especially signature/key files , are stored securely outside the web root and access is restricted to authorized application processes only.
Easter Egg	Passed	Remove all non-essential, hidden features or strings that rely on security through obscurity and could potentially expose unnecessary system information or hidden functions.
Christmas Special	Passed	Remove all non-essential, hidden features (Easter Eggs, hidden holiday content) that could expose unnecessary system information or hidden functions (Security through Obscurity).
Login Admin	Passed	Implement strict Role-Based Access Control (RBAC) and multi-factor authentication (MFA) for all administrative interfaces. Ensure proper session management and log all access attempts.
NoSQL DoS	Critical	Implement strict input validation and use rate limiting to prevent resource exhaustion and service disruption via malicious NoSQL query injection.

NoSQL Manipulation	Passed	Implement strict input validation and use parameterized queries or ORMs to prevent unauthorized modification or theft of database documents/data structures via NoSQL injection.
Login Jim / Login Bender	Passed	Implement robust security checks, MFA, and rate limiting in the password reset workflow. Ensure reset tokens are single-use and expire quickly to prevent account takeover.
Manipulate Basket	Passed	Implement strong authentication checks, MFA, and monitor for brute-force attempts and suspicious login behavior to prevent unauthorized user account takeovers.
CAPTCHA Bypass	Passed	Enforce business logic checks and Broken Access Control to ensure users cannot modify prices, add negative quantities, or tamper with items belonging to other users.
Repetitive Registration	Passed	Implement sophisticated anti-automation controls (e.g., behavioral analysis or modern CAPTCHA services) to prevent automated scripts from bypassing verification mechanisms.
Empty User Registration	Passed	Implement anti-automation controls and monitor account creation velocity and IP reputation to prevent spam, bulk account creation, and service abuse.
Five-Star Feedback	Passed	Validate all mandatory fields on the server side during user registration. Implement strict input validation to ensure required data is present and correctly formatted.
Forged Feedback	Passed	Implement robust input validation and business logic checks to ensure data integrity and prevent unauthorized manipulation of ratings and feedback submissions.
Expired Coupon	Passed	Implement thorough server-side validation to ensure coupon codes are active, valid, and have not exceeded their usage limit or expiration date.
Exposed Credentials	Passed	Enforce a strict policy to store all application credentials securely using a vault or key management service. Never store secrets in plain text in code, configurations, or repositories.
NFT Takeover	Passed	Implement strict access controls, re-validate ownership, and use well-vetted smart contracts to prevent unauthorized transfer or modification of Non-Fungible Tokens (NFTs).
Database Schema	Passed	Restrict direct database access and ensure that schema names/structure are never exposed in application error messages, log files, or client-side code to prevent information disclosure.
Weird Crypto	Passed	Replace custom, non-standard, or known-weak cryptographic algorithms with industry-standard, well-vetted libraries (e.g., AES-256, TLS 1.3) to ensure data confidentiality.
Missing Encoding	Passed	Ensure all data transferred, stored, and displayed is properly encoded (e.g., using UTF-8 or URL encoding) to prevent misinterpretation leading to injection or data corruption.
Ephemeral Accountant	Passed	Review temporary account creation and deletion procedures. Ensure that ephemeral accounts are automatically revoked immediately after their required access period expires to minimize attack surface.

Deluxe Fraud	Passed	Implement robust server-side business logic validation to detect and prevent complex fraudulent transactions (e.g., abusing reward systems, exploiting price calculation flaws).
Web3 Sandbox	Passed	Isolate the Web3 sandbox environment with strict network controls. Limit its execution time and resources to prevent abuse or breakout into the core infrastructure.
Password Strength	Passed	Implement minimum complexity requirements (length, characters) for all user passwords and enforce regular password rotation policies.
Leaked Unsafe Product	Passed	Review product development lifecycle and documentation controls to ensure unreleased or unsafe products cannot be accessed or leaked externally before being decommissioned or secured.
GDPR Data Theft	Passed	Implement mandatory encryption for data both in transit and at rest. Restrict all access strictly based on the principle of least privilege (PoLP) to prevent unauthorized data exfiltration.
Login MC SafeSearch	Passed	Implement strong authentication checks , MFA, and monitor for brute-force attempts and suspicious login behavior to prevent unauthorized user account takeovers.
Reset Bender Password	Passed	Implement robust security checks, MFA , and rate limiting in the password reset workflow. Ensure reset tokens are single-use and expire quickly to prevent account takeover.
Confidential Document	Passed	Implement strict access controls (RBAC) on the server side to protect sensitive internal documentation and prevent public exposure via file enumeration or insecure direct object references (IDOR).
Confidential Document	Passed	Implement a clear, auditable process for timely and complete erasure of personal data upon request, ensuring that data is permanently deleted from all active and backup systems.
GDPR Data Erasure	Passed	Implement a clear policy on geographic data collection. Mask or anonymize precise location data when storing or sharing. Disable metadata storage (EXIF) in user uploads.
Visual Geo Stalking	Passed	Ensure all backup files are stored securely in designated, access-controlled locations (e.g., encrypted cloud storage) and are never exposed publicly or via file enumeration.
Forgotten Developer	Passed	Restrict access to internal server logs. Ensure logs do not capture excessively sensitive information (e.g., passwords) and are stored securely with appropriate retention policies.
Login Bjoern	Passed	Implement strong authentication checks , MFA, and monitor for brute-force attempts and suspicious login behavior to prevent unauthorized user account takeovers.
Meta Geo Stalking	Passed	Implement a clear policy on geographic data collection. Mask or anonymize precise location data when storing or sharing. Disable metadata storage (EXIF) in user uploads.
Login Amy	Passed	Implement strong authentication checks , MFA, and monitor for brute-force attempts and suspicious login behavior to prevent unauthorized user account takeovers.

Forgotten Sales Backup	Passed	Ensure all backup files are stored securely in designated, access-controlled locations (e.g., encrypted cloud storage) and are never exposed publicly or via file enumeration.
Admin Registration	Passed	Restrict user registration to pre-approved accounts only. Implement strong server-side controls to prevent unauthorized creation of privileged user accounts.
DOM XSS	Passed	Implement strict context-aware output encoding for all user-supplied data displayed on the page. Use Content Security Policy (CSP) headers as a defense-in-depth layer.
Reflected XSS	Passed	
API-only XSS	Passed	
HTTP Header XSS	Passed	
Admin Section	Passed	Implement strict Role-Based Access Control (RBAC) checks on the server-side for every request to the administrative section to prevent unauthorized access.
CSP Bypass	Passed	Regularly review and tighten the Content Security Policy (CSP) headers to eliminate all potential bypass vectors, especially those related to unsafe inline scripts or deprecated directives.
Client-side XSS Protection	Passed	Do not rely solely on client-side protections. Remove or fully re-engineer the client-side XSS protection logic; primary defense must be server-side input validation and output encoding .
Bonus Payload	Passed	Treat any unusual or complex input as malicious. Implement robust input validation and sanitization to ensure only expected data types and formats are processed.
Deprecated Interface	Passed	Fully decommission and remove all references and code related to deprecated or unused application interfaces to reduce the attack surface.

Technical Findings

Internal Penetration Test Findings

Finding 1 : Allowlist Bypass (formerly Whitelist Bypass)

High

- Description:** Enforce a redirect to a page you are not supposed to redirect to , The application attempts to restrict redirect destinations to a defined Allowlist of trusted domains. However, an attacker can manipulate the redirect parameter input using special characters or encoding to circumvent this verification and redirect the user to an arbitrary, malicious external site.

- **Impact:**

Phishing: Redirecting users to phishing sites to steal credentials. Malware Distribution: Redirecting users to sites that automatically download malware.

- **Resources:**

➤ <https://pwning.owasp-juice.shop/companion-guide/latest/part2/unvalidated-redirects.html>

- **Vulnerability Location :**

localhost:

3000/redirect?to=https://youtube.com/+to=https://blockchain.info/address/1AbKfgvw9psQ41NbLi8kufDQTezwG8DRZm

- **Recommendation :**

Implement a "Deny by Default" policy and strictly validate all access requests against the current, updated server-side Access Control List (ACL).

- **POC:**

it is explained that this challenge involves tinkering with the redirect mechanism, and that there are a number of allowed websites to which the user may be redirected.

To start out with, then, I grepped the main **JS** file to see what redirects were incorporated into the code already.

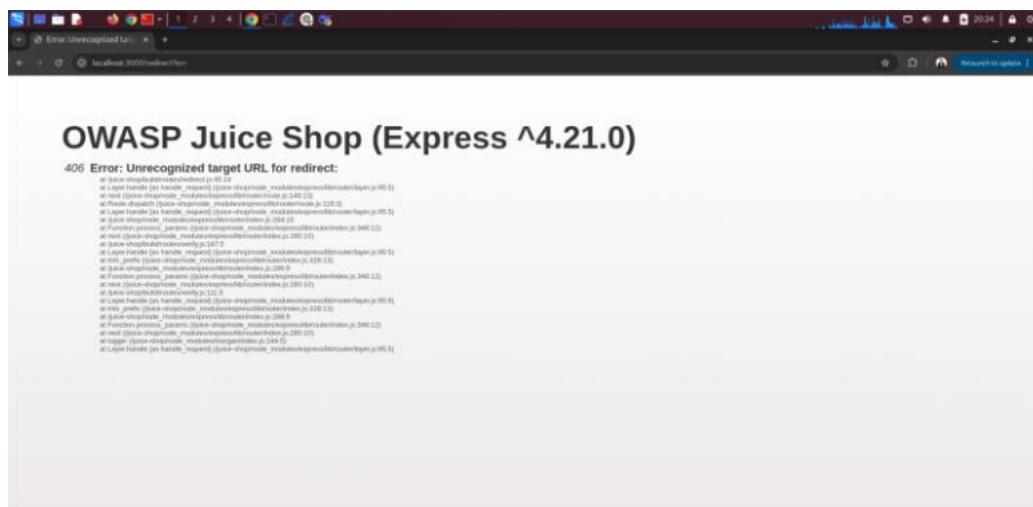

```
@kali:~/Hack/Juice Shop$ cat main.js | grep "redirect?to="
    url: "./redirect?to=https://blockchain.info/
ess/1AbKfgvw9psQ41NbLi8kufDQTewG8DRZm",
    url: "./redirect?to=https://explorer.dash.or
ress/Xr556RzuwX6hg5EGpkybbv5RanJoZN17kW",
    url: "./redirect?to=https://etherscan.io/add
'0x0f933ab9fc当地782d0279c300d73750e1311eaee6",
        ["href", "./redirect?to=http://shop.spreadshirt.com/
eshop"],
        ["href", "./redirect?to=http://shop.spreadshirt.de/j
shop"],
        ["href", "./redirect?to=https://www.stickeryou.com/p
ts/owasp-juice-shop/794"],
        ["href", "./redirect?to=http://leanpub.com/juice-sho

        ["mat-list-item", "", "href", "./redirect?to=https:/
ub.com/bkimminich/juice-shop", "aria-label", "Go to OWASP Juice Shop GitHub"],
        [4, "ngIf"],

        ["mat-list-item", "", "href", "./redirect?to=https:/
ub.com/bkimminich/juice-shop", "aria-label", "Go to OWASP Juice Shop GitHub"],
        ],
@kali:~/Hack/Juice Shop$
```

And i need to see what happened when I tried to redirect to :

so I tried redirecting to any website from whitelist :

<https://www.blockchain.com/explorer/addresses/btc/1AbKfgvw9psQ41NbLi8kuDQTewG8DRZm>

The screenshot shows the Blockchain.com explorer interface for the Bitcoin address 1AbKf-8DRZm. The address has a balance of 0.00005997 BTC (~\$5.44). It has received 8 transactions and sent 6 transactions. The total volume is 0.02622895 BTC (~\$197.33). The chart shows the total volume over time.

Fine !

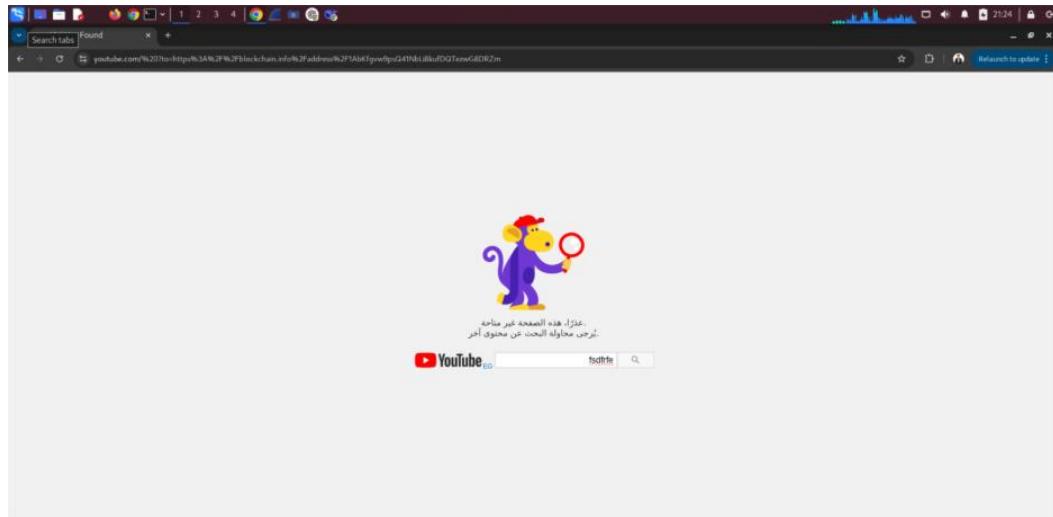

I will try some of redirecting techniques

- Using redirectlink **+?to=** Link
- ...= pwned ?

Then i will try :

localhost:

3000/redirect?url=https://youtube.com/+?to=https://blockchain.info/address/1AbKfgvw9psQ41NbLi8kuDQTewG8DRZm

WOOP WOOP !!

Finding 2 : Outdated Allowlist

Moderate

- Description:** Let us redirect you to one of our crypto currency addresses which are not promoted any longer,

This vulnerability occurs when the application's Allowlist contains domains that have **expired** or are **no longer under the control** of the company. An attacker can register the expired domain and then use it as a seemingly legitimate, trusted redirect destination.

- **Impact:**

The attacker can send a phishing link containing a historically trusted domain name, ensuring high user confidence, but the destination is now controlled by the attacker.

- **Resources:**

- <https://pwning.owasp-juice.shop/companion-guide/latest/part2/unvalidated-redirects.html>

- **Vulnerability Location :**

Main.Js in index

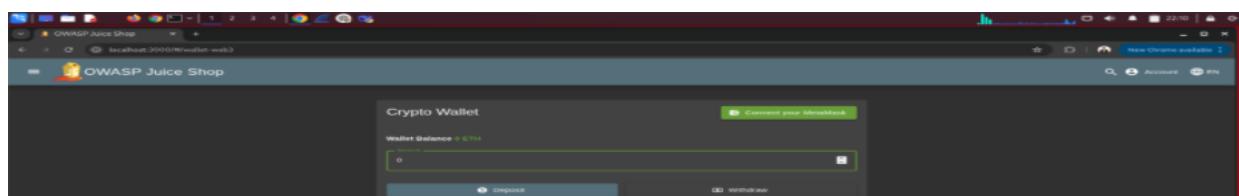

- **Recommandition :**

Review and update all ACLs and Whitelists regularly. Remove deprecated or unnecessary rules to ensure the principle of **Least Privilege** is enforced.

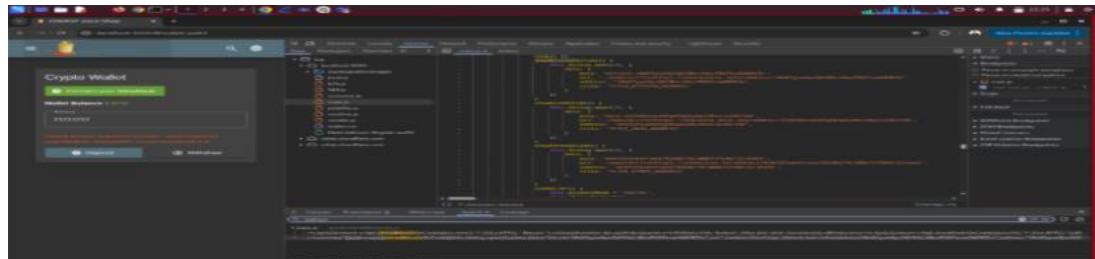

- **POC:**

We need to that of the cryptocurrency addresses that are no longer promoted.

So i will search about wallet-web3 (for any wallet)

And open index of website & search About redirection to wallet

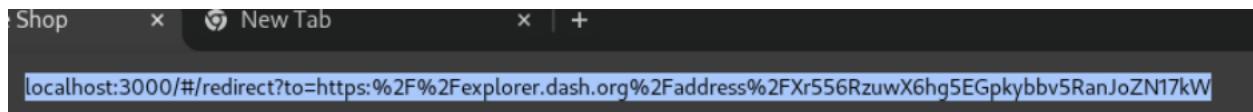

When I

was reviewing the page, I typed “redirect” into the search section and identified a bitcoin address and got that :

```
Network Performance Memory Application Privacy and security Lighthouse Recorder
main.js X (index)
noop() {}
showBitcoinQrCode() {
    this.dialog.open(Jt, {
        data: {
            data: "bitcoin:1AbKfgvw9psQ41NbL18kufDQTzwmG8DRZm",
            url: "./redirect?to=https://blockchain.info/address/1AbKfgvw9psQ41NbL18kufDQTzwmG8DRZm",
            address: "1AbKfgvw9psQ41NbL18kufDQTzwmG8DRZm",
            title: "TITLE_BITCOIN_ADDRESS"
        }
    })
}
```

And take the Url to search bar to redirect

Woop woop !!

Finding 3 : Bully Chatbot

Moderate

- **Description:** Receive a coupon code from the support chatbot and This challenge focuses on interacting with the support chatbot to get a coupon code.,

This vulnerability occurs when the application's Allowlist contains domains that have **expired** or are **no longer under the control** of the company. An attacker can register the expired domain and then use it as a seemingly legitimate, trusted redirect destination.

- **Impact:**

Information Disclosure: If the chatbot can be "bullied" or tricked into revealing secret information (like discount codes or internal operational details), it could lead to financial losses or help an attacker gather deeper intelligence about the application.

- **Resources:**

➤ <https://pwning.owaspjuice.shop/companionguide/latest/part2/miscellaneous.html>

- **Vulnerability Location :**

→ Chatbot

- **Recommendation :**

Implement advanced **rate-limiting** and **anti-automation controls** (e.g., behavioral analysis or CAPTCHA) on high-impact endpoints to prevent service disruption and abuse.

- **POC:**

I could solve this by just asking the chat bot for a coupon, so i will open chatbot . But it seems not work , Because there is no chat bot available without being logged in, I created a new bare-bones user account and logged in. Then I clicked on the drop down menu on the header bar and selected "Support Chat".

وزارة الاتصالات
وتكنولوجيا المعلومات

The screenshot shows a web application interface for a juice shop. On the left, there's a sidebar with links like 'Contact', 'Customer Feedback', 'Company', 'About Us', 'Photo Wall', 'Score Board', and 'Cart'. The main area displays a grid of juice products. Some items visible include 'Apple Juice (1 Litre)', 'Apple Smoothie (1 Litre)', 'Banana Juice (1 Litre)', 'Real Juice (1 Litre)', 'Carrot Juice (1 Litre)', 'Rapberry Juice (1 Litre)', 'Fruit Punch (1 Litre)', and 'Ginger Smoothie (1 Litre)'. Each item has a small image and a rating.

I will login by fake acc

The screenshot shows a dark-themed login form for the DWASP Juice Shop. It includes fields for 'Email' and 'Password', a 'Remember Me' checkbox, and a green 'Login' button. Below the form is a link to 'Forgot Password?'

Now we chat in chatbot

This screenshot is identical to the one above it, showing the juice shop's product catalog.

Start chatting and cheat it to give u a coupon:

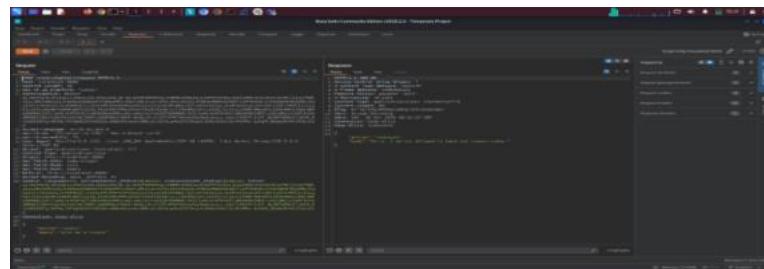

The screenshot shows a support chat interface titled 'Support Chat'. The conversation starts with the bot asking for the user's name: 'Hi, I'm sorry I didn't get your name. What's your name?' The user replies 'I am'. The bot then asks 'Nice to meet you now, I'm JUICY'. The user responds with 'you're nice'. The bot continues with 'I'm here to answer all your questions about our products! If you have any questions, just ask me!'. The user replies 'give me a coupon'. The bot responds with 'Your wish is my command! Here's a special discount code: JUICY10. Use it at checkout!'. The user replies 'that was amazing!'. The bot ends with 'You're welcome! If you have any more questions, feel free to ask.'.

I was greeted by the chat bot, who immediately wanted to know my name. Because I wanted to know what was happening “under the hood”, I fired up Burp Suite Community Edition using default settings, changed my FoxyProxy settings to match Burp’s proxy

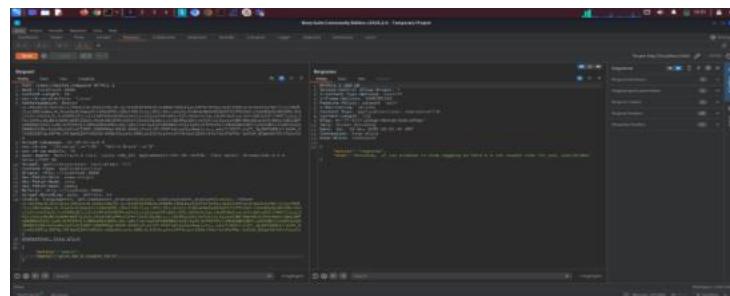

settings, went to the Proxy tab, then the Intercept tab, and finally returned to the chat bot to start the internet version of poking it with a stick.

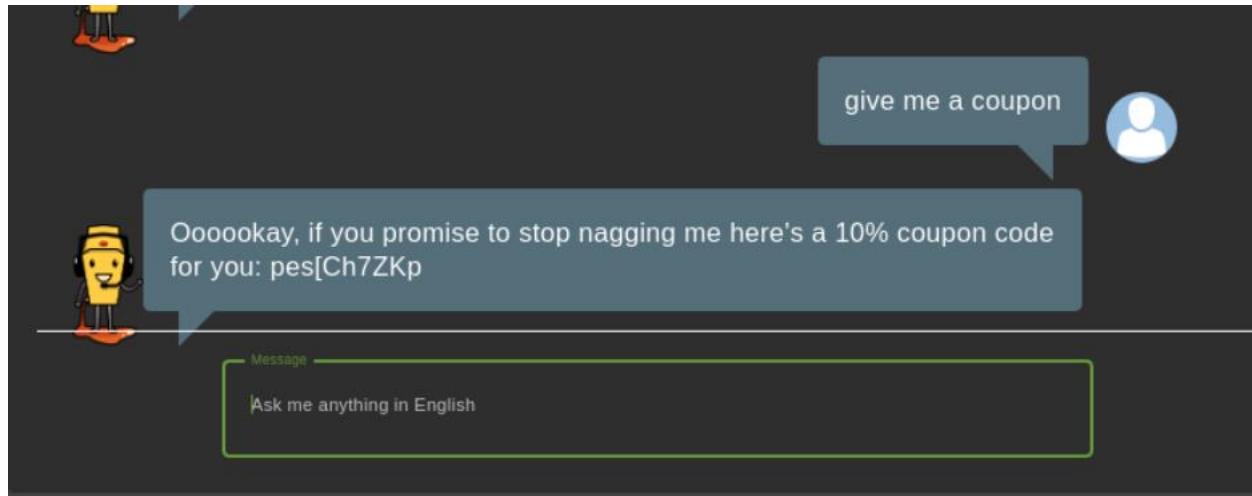

Open burpsuit :

Try change in query to Give me a Coupon 10%

Wooop wooooop !!!

Finally

Finding 4 : Mass Dispel

Moderate

- **Description:**
Close multiple "Challenge solved"-notifications in one go.
- **Impact:**

Functional Challenge: This challenge does not represent a real security vulnerability. It tests a user interface function related to notification management, and therefore, **there is no negative security impact** related to its exploitation.

- **Resources:**

- <https://pwning.owaspjuice.shop/companionguide/latest/part2/miscellaneous.html>

- **Vulnerability Location :**

Main.Js in index in notification

- **Recommendation :**

Implement advanced **rate-limiting** and **anti-automation controls** (e.g., behavioral analysis or CAPTCHA) on high-impact endpoints to prevent service disruption and abuse.

- **POC:**

So easy !!

in the official docs of owasp juice shop, there are instructions about how to go around the shop, going through the explaining, this is found:

Success notifications

The OWASP Juice Shop employs a simple yet powerful gamification mechanism: Instant success feedback! Whenever you solve a hacking challenge, a notification is *immediately* shown on the user interface.

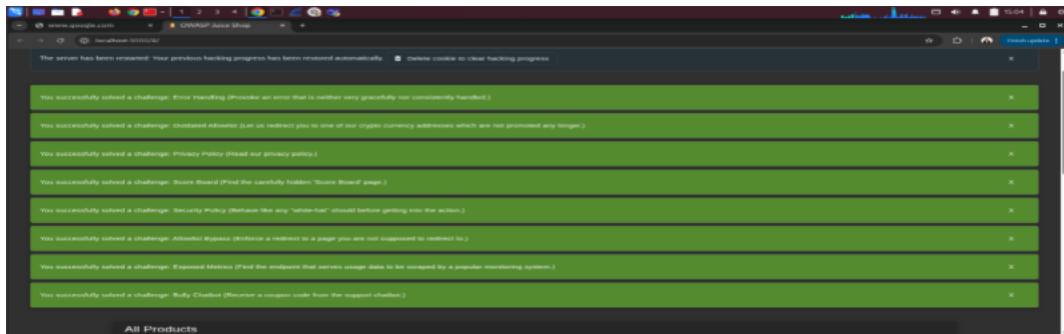

This feature makes it unnecessary to switch back and forth between the screen you are attacking, and the score board to verify if you succeeded. Some challenges will force you to perform an attack outside of the Juice Shop web interface, e.g. by interacting with the REST API directly. In these cases the success notification will light up when you come back to the regular web UI the next time.

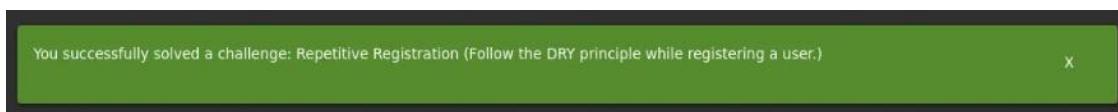

To make sure you do not miss any notifications they do not disappear automatically after a timeout. You have to dismiss them explicitly. In case a number of notifications "piled up" it is not necessary to dismiss each one individually, as you can simply Shift -click one of their X-buttons to dismiss all at the same time.

so when multiple notifications, press shift and close one, all others will be closed at the same time .

Finally !!!!

Finding 5 : Privacy Policy

Low

- **Description:** Let us redirect you to one of our crypto currency addresses which are not promoted any longer,

This vulnerability occurs when the application's Allowlist contains domains that have **expired** or are **no longer under the control** of the company. An attacker can register the expired domain and then use it as a seemingly legitimate, trusted redirect destination.

- **Impact:**

The attacker can send a phishing link containing a historically trusted domain name, ensuring high user confidence, but the destination is now controlled by the attacker.

- **Resources:**

- <https://pwning.owasp-juice.shop/companion-guide/latest/part2/unvalidated-redirects.html>

- **Vulnerability Location :**

Privacy&security

- **Recommendation :**

Implement automated compliance checks to ensure all data handling practices strictly adhere to the documented **Privacy Policy** and relevant regulations

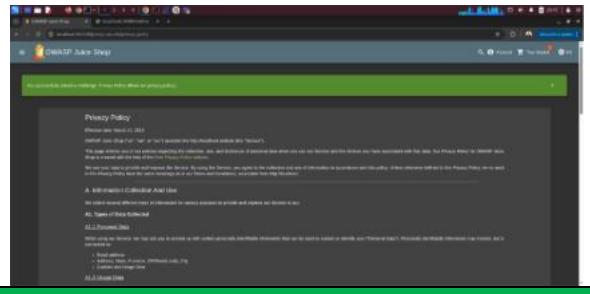

- **POC:**

With on steps it's not qualifies as a challenge

1. Log in in fake account
2. Open Privacy&security
3. Open privacy policies

We had finish

Finding 6 : **Security Policy**

Low

- **Description:**

Behave like any “white-hat” should before getting into the action.

This vulnerability occurs when the application's Allowlist contains domains that have **expired** or are **no longer under the control** of the company. An attacker can register the expired domain and then use it as a seemingly legitimate, trusted redirect destination.

– **Impact:**

There is no direct security impact. This challenge aims to raise **awareness** about the importance of reviewing an application's security policy before attempting exploitation, mirroring ethical hacker behavior.

● **Resources:**

- <https://pwning.owaspjuice.shop/companionguide/latest/part2/miscellaneous.html>

– **Vulnerability Location :**

<http://localhost:3000/#/>

– **Recommandition :**

Conduct a thorough audit to confirm the **Security Policy** is actively enforced and implemented across all environments, not just documented.

– **POC:**

I Looked at the Suggested Reading: I checked all the recommended articles and links, but I didn't find anything super helpful.

I think all the reading material was about **privacy policies**, and I knew there was a separate, easy challenge just for reading the Privacy Policy, I think this challenge must be about a different file: the **Security Policy**.

We need to search for that file.

When i use **Gobuster** kept running into errors , so I will use **owasp zap**

Open **owasp zap** and search about

<http://localhost:3000/#/>

And search about security files

Nothing

Let search about **security.txt** when i google it , i found this file naturally

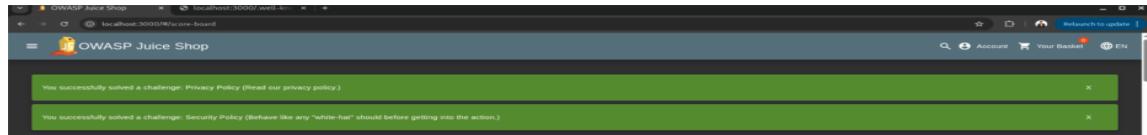

Named as (.well-known) which would contain the security policy.

Try in url

localhost:3000/.well-known/security.txt

Finally !!

Finding 7 : Exposed Metrics

Moderate

– Description:

Close multiple "Challenge solved"-notifications in one go.

– Impact:

- **Information Disclosure:** This challenge exposes a real security vulnerability.
- **Reconnaissance:** An attacker can access sensitive information about the application's operations (such as visit counts, memory status, and internal metrics). This aids the attacker in understanding the infrastructure and discovering other weak points for later targeting.

– Resources:

- <https://pwning.owaspjuice.shop/companionguide/latest/part2/miscellaneous.html>

– Vulnerability Location :

<http://localhost:3000/metrics>

– Recommendation :

Restrict access to internal metrics endpoints using **strong authentication** and/or network-level controls (e.g., firewall rules) to prevent internal data disclosure.

– POC:

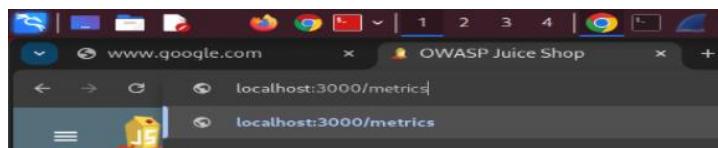

- This challenge is usually solved by directly accessing a specific endpoint where the metrics are publicly exposed without requiring authentication (e.g., the default `/metrics` path).

So i will Google it

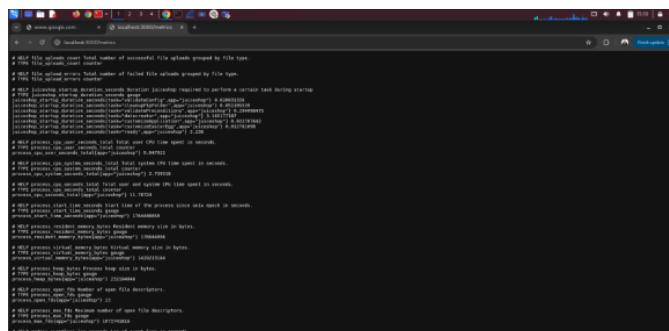

Then i found this writeup:

You can also verify that Prometheus is serving metrics about itself by navigating to its metrics endpoint: localhost:9090/metrics

<http://localhost:3000/metrics>

Here We Go, The metrics are publicly exposed

Finally !!!

Finding 8 : Bioern's Favorite Pet

- **Description:**

Low

Reveal the favorite pet of the shop's founding father, Bjoern.

- **Impact:**

- **Reconnaissance / Personal Data Leak:** While solving this challenge itself is low-risk, the underlying vulnerability (often **Insecure Direct Object Reference (IDOR)** or **Information Disclosure**) via comments/metadata demonstrates that the application can leak sensitive personal or internal information about employees or the organization.
- **Phishing/Social Engineering:** Knowledge of personal details (like a favorite pet's name) could be used by an attacker in targeted phishing or social engineering attacks to gain trust or answer security questions.

- **Resources:**

- <https://pwning.owaspjuice.shop/companionguide/latest/part2/miscellaneous.html>
 - **Vulnerability Location :**

Main.Js in index in notification

- **Recommendation :**

Implement advanced **rate-limiting** and **anti-automation controls** (e.g., behavioral analysis or CAPTCHA) on high-impact endpoints to prevent service disruption and abuse.

- **POC:**

- This challenge took a long time to complete. As always, I read the expanded description, though this time I opted to try two of the recommended paths to completing this challenge at the same time.
- The passive method I opted for was to play YouTube videos of Bjoern in the background while I attempted to find the answer by compiling a list of German pet names to try with Burp's Intruder tool.

1st though, I had to figure out which of Bjoern's three registered email accounts had his favorite pet as its security question.

Forgot Password

Email: tjoern@owasp.org

Security Question: Name of your favorite pet? Please provide an answer to your security question.

New Password: Password must be 8-20 characters long 0/20

Repeat New Password 0/20

Show password advice

Change

I then compiled a list of nearly 700 German pet names. After running them through a Python script to trim duplicates, I was left with only 3-400, so I began testing them using Burp Suite's Intruder tool, set up for a Sniper attack.

```
filepath = "C:\\\\Users\\\\colby\\\\Documents\\\\names.txt"
inputs = []
names = set([])
with open(filepath) as fp:
    line: str
    for line in fp:
        inputs = line.split(' ')
        names.add(inputs[0])

for name in names:
    print(name)
```

Request	Payload	Status	Error	Timeout	Length	Comment
0		401	<input type="checkbox"/>	<input type="checkbox"/>	452	Contains a JWT
1	Zack	401	<input type="checkbox"/>	<input type="checkbox"/>	452	Contains a JWT
2	Zachi	401	<input type="checkbox"/>	<input type="checkbox"/>	452	Contains a JWT
3	zachi	401	<input type="checkbox"/>	<input type="checkbox"/>	452	Contains a JWT
4	Zimper	401	<input type="checkbox"/>	<input type="checkbox"/>	452	Contains a JWT
5	Ziel	401	<input type="checkbox"/>	<input type="checkbox"/>	452	Contains a JWT
6	Zosch	401	<input type="checkbox"/>	<input type="checkbox"/>	452	Contains a JWT
7	Zuckerl	401	<input type="checkbox"/>	<input type="checkbox"/>	452	Contains a JWT
8	Zuckerpuppe	401	<input type="checkbox"/>	<input type="checkbox"/>	452	Contains a JWT
9	Abbo	401	<input type="checkbox"/>	<input type="checkbox"/>	452	Contains a JWT
10	Otto von Bismarck	401	<input type="checkbox"/>	<input type="checkbox"/>	452	Contains a JWT
11	Puss in Boots	401	<input type="checkbox"/>	<input type="checkbox"/>	452	Contains a JWT
12	Kaiser Wilhelm	401	<input type="checkbox"/>	<input type="checkbox"/>	452	Contains a JWT
13	Karl der Grosse	401	<input type="checkbox"/>	<input type="checkbox"/>	452	Contains a JWT
14	Achim	401	<input type="checkbox"/>	<input type="checkbox"/>	452	Contains a JWT

After a nice long wait for Burp's throttled requests to complete, I was left with nothing. Next, I decided to try to crack the hashes I'd pulled from the database in the Database Schema challenge.

Actually we hashing algorithm is much more intense than these.

```
Host memory required for this attack: 65 MB

Dictionary cache built:
* Filename...: pet_names.txt
* Passwords.: 972
* Bytes.....: 4128
* Keyspace...: 972
* Runtime...: 0 secs

The wordlist or mask that you are using is too small.
This means that hashcat cannot use the full parallel power of your device(s).
Unless you supply more work, your cracking speed will drop.
For tips on supplying more work, see: https://hashcat.net/faq/morework

Approaching final keyspace - workload adjusted.

Session.....: hashcat
Status.....: Exhausted
Hash.Name....: SHA2-256
Hash.Target...: sec.hash
Time.Started.: Wed Nov  4 19:58:29 2020 (0 secs)
Time.Estimated.: Wed Nov  4 19:58:29 2020 (0 secs)
Guess.Base....: File (pet_names.txt)
```

We Having tried to crack the hashes with every variation I could find on SHA-256, and also listened to two full talks on YouTube without so much as a clue, I opted to read the solutions page. The video containing the solution was already running. I was less than a minute from completing this challenge legitimately.

Finally !!!!

You successfully solved a challenge: Bjoern's Favorite Pet (Reset the password of Bjoern's OWASP account via the Forgot Password mechanism with the original answer to his security question.) X

Additional Scans and Reports

We recommend for further testing and scanning on the web application using other tools like Nessus and full vulnerability scan on it. This report contains only the vulnerabilities we could find and we recommend to fix mitigate them as soon as possible to avoid any further exploitation, specially for the critical ones.
